open source buzz words

Open

Free/libre

Transparent

Collaborative

Social coding

Crowd sourcing

Yada yada yada ...

how it can sound ...

what we really want is ...

Open Data + Open Algorithms + Open Software + Open Peer Review
+ Open Access = OPEN SCIENCE

Thereby, science can be:

- ✓ Transparent
- ✓ Reproducible
- ✓ Transferrable
- ✓ Credible!
- ✓ Durable, sustainable
- ✓ Collaborative

IMPORTANT!

No conflict between IPR and licensing.

SO ...

reproducibility crisis

In relevant academic publications:

- Algorithmic documentation is incomplete
- Unavailability of:
 - Data
 - Software code
 - Ancillary code (e.g. for creating figures)
- Results cannot be replicated and verified

Why?

- Rapid computational revolution, unmatched IT skills
- Main barrier: perceived lack of time for sharing code

incentives?

“What’s in it for me?”

“What will I have to show for my efforts?”

Incentive structures must be aligned to encourage genuine collaboration.

- ✓ Personal incentives (career advancement, job satisfaction)
- ✓ Organizational incentives
- ✓ National incentives

Measuring “impact”.

open source community approach

To build a better computational foundation for science that would be, compared to the existing commercial alternatives and traditions:

- ✓ Technically superior.
- ✓ Openly developed from the start: no more black boxes.
- ✓ Based on validated, tested, documented, reusable code whose problems are publicly discussed and tracked.
- ✓ Built collaboratively, with everyone participating as equal partners and worrying first about solving the problems, not about who is first author or grant PI.
- ✓ Licensed as open source but in a way that encourages industry participation and collaboration.

what is “community”?

“a specific group of people, from a particular patch of earth, who knew and judged and kept an eye on one another, who shared habits and history and memories, and could at times be persuaded to act as a whole on behalf of a part.”

Anand Giridharadas

Examples:

“... is a pillar of the community.”

“A bad man is a plague spot in a community.”

“communities”

Intelligence community

Business community

Faith community

European Community

International community

Software developer community

Scientific community

Medical community

Venture capital community

roll of community

Less about looking out for each other (although we s

More about lobbying for the same things.

“People will only trust your product ... if you show th
about the product but about the community you wis

mitigating the reproducibility crisis

A minimum standard for publication.

Authors: in a Section called e.g. “Computational procedures”:

- ✓ Statement describing code availability and accessibility
- ✓ High-level description of computational environment, with DOI or URL references
- ✓ Use a code repository (version control!) containing exact OS and software versions
- ✓ Provide log files reflecting processing steps

Reviewers: is there enough information to allow testing/repeating by others?

open science solutions

Marketable skill

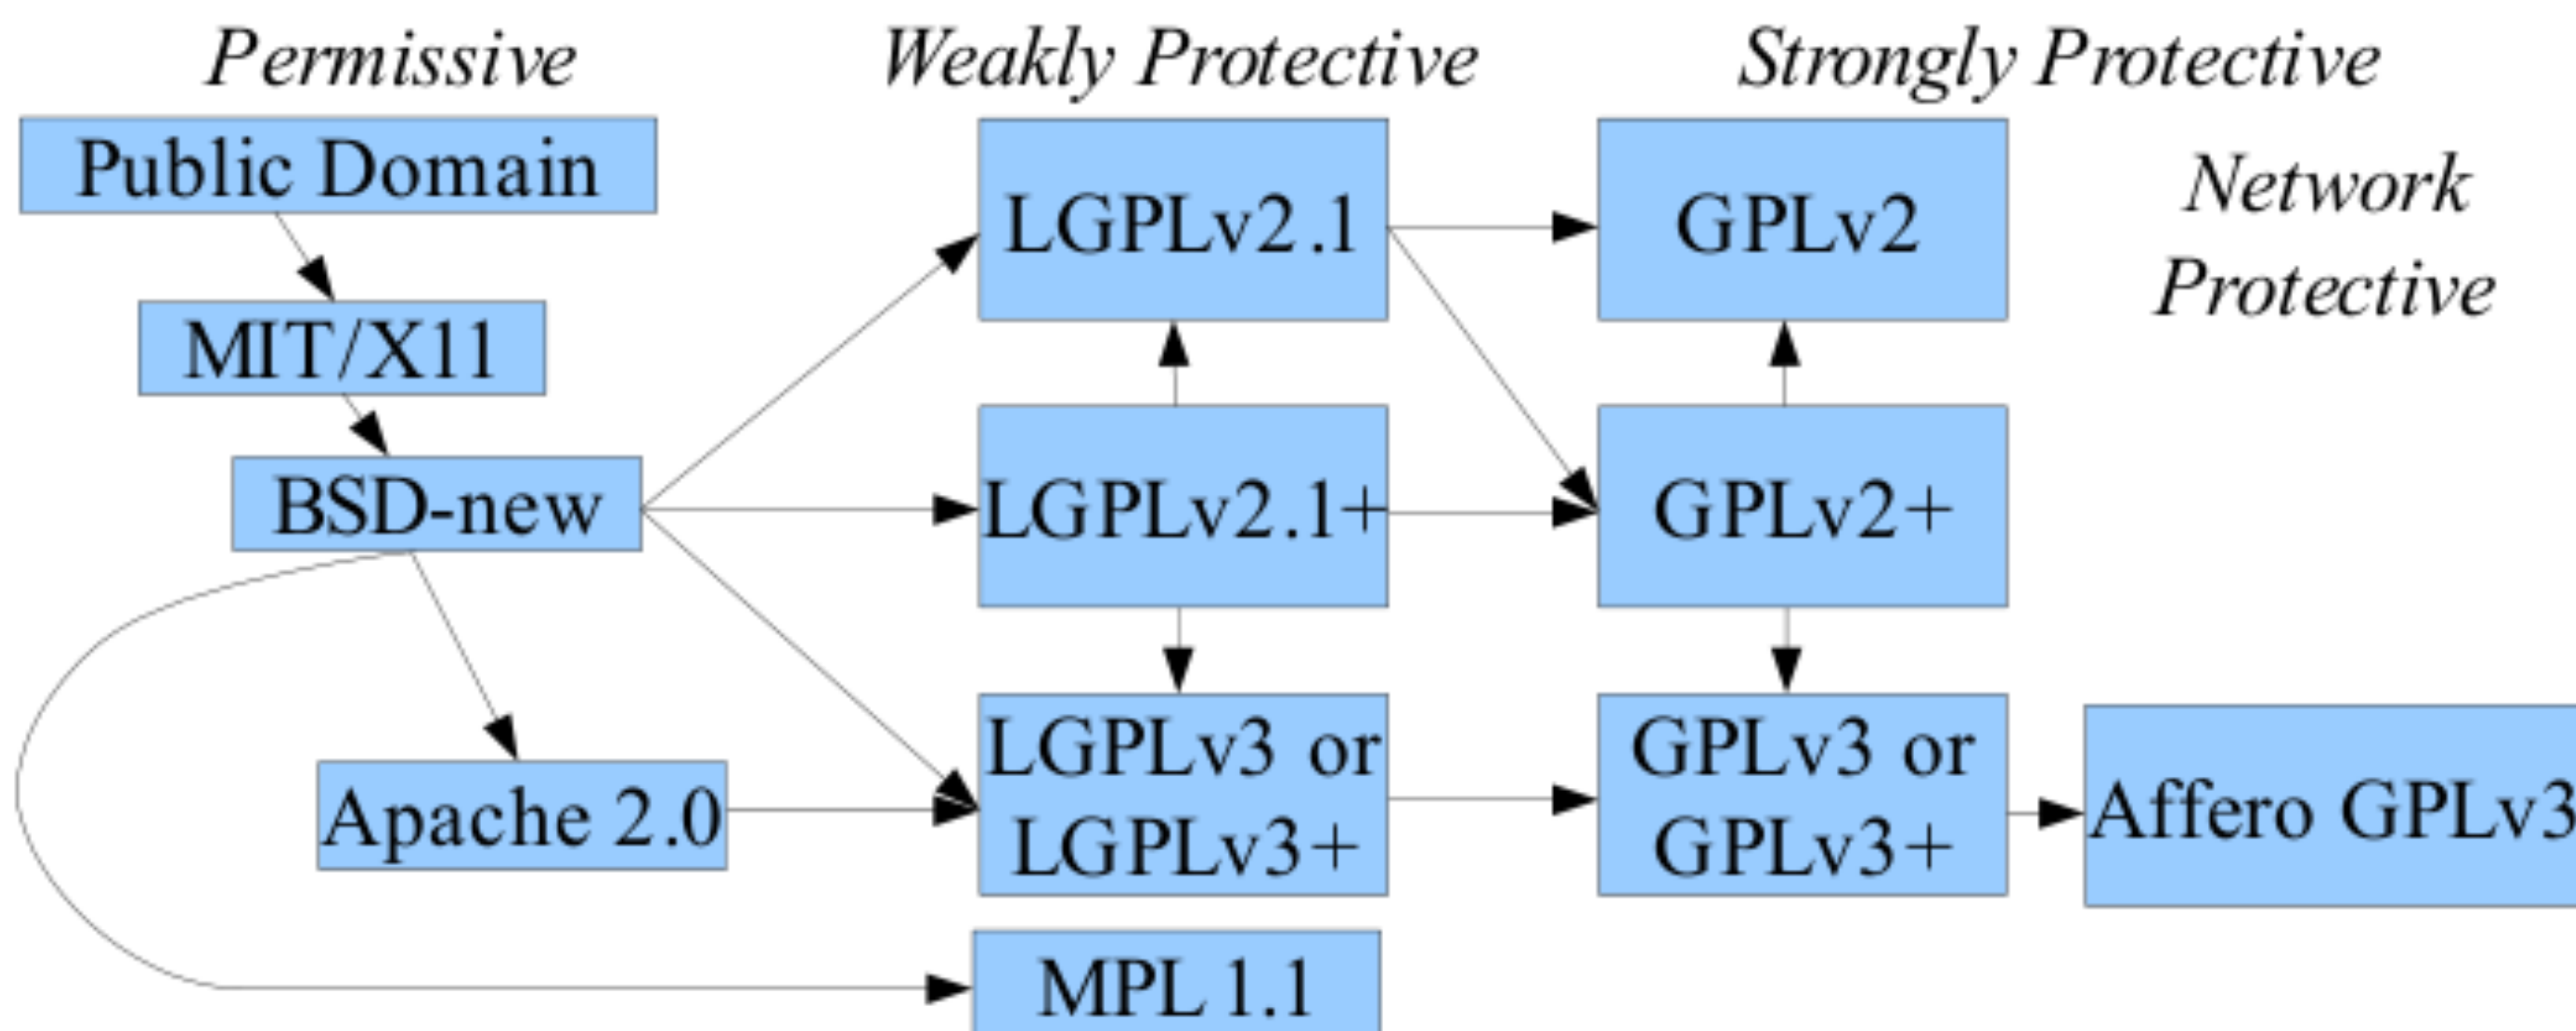

- ✓ Easier to recruit/replace, succession plan
- ✓ Increases work gratification (potentially)

licensing - floss

Free/libre and Open Source Software

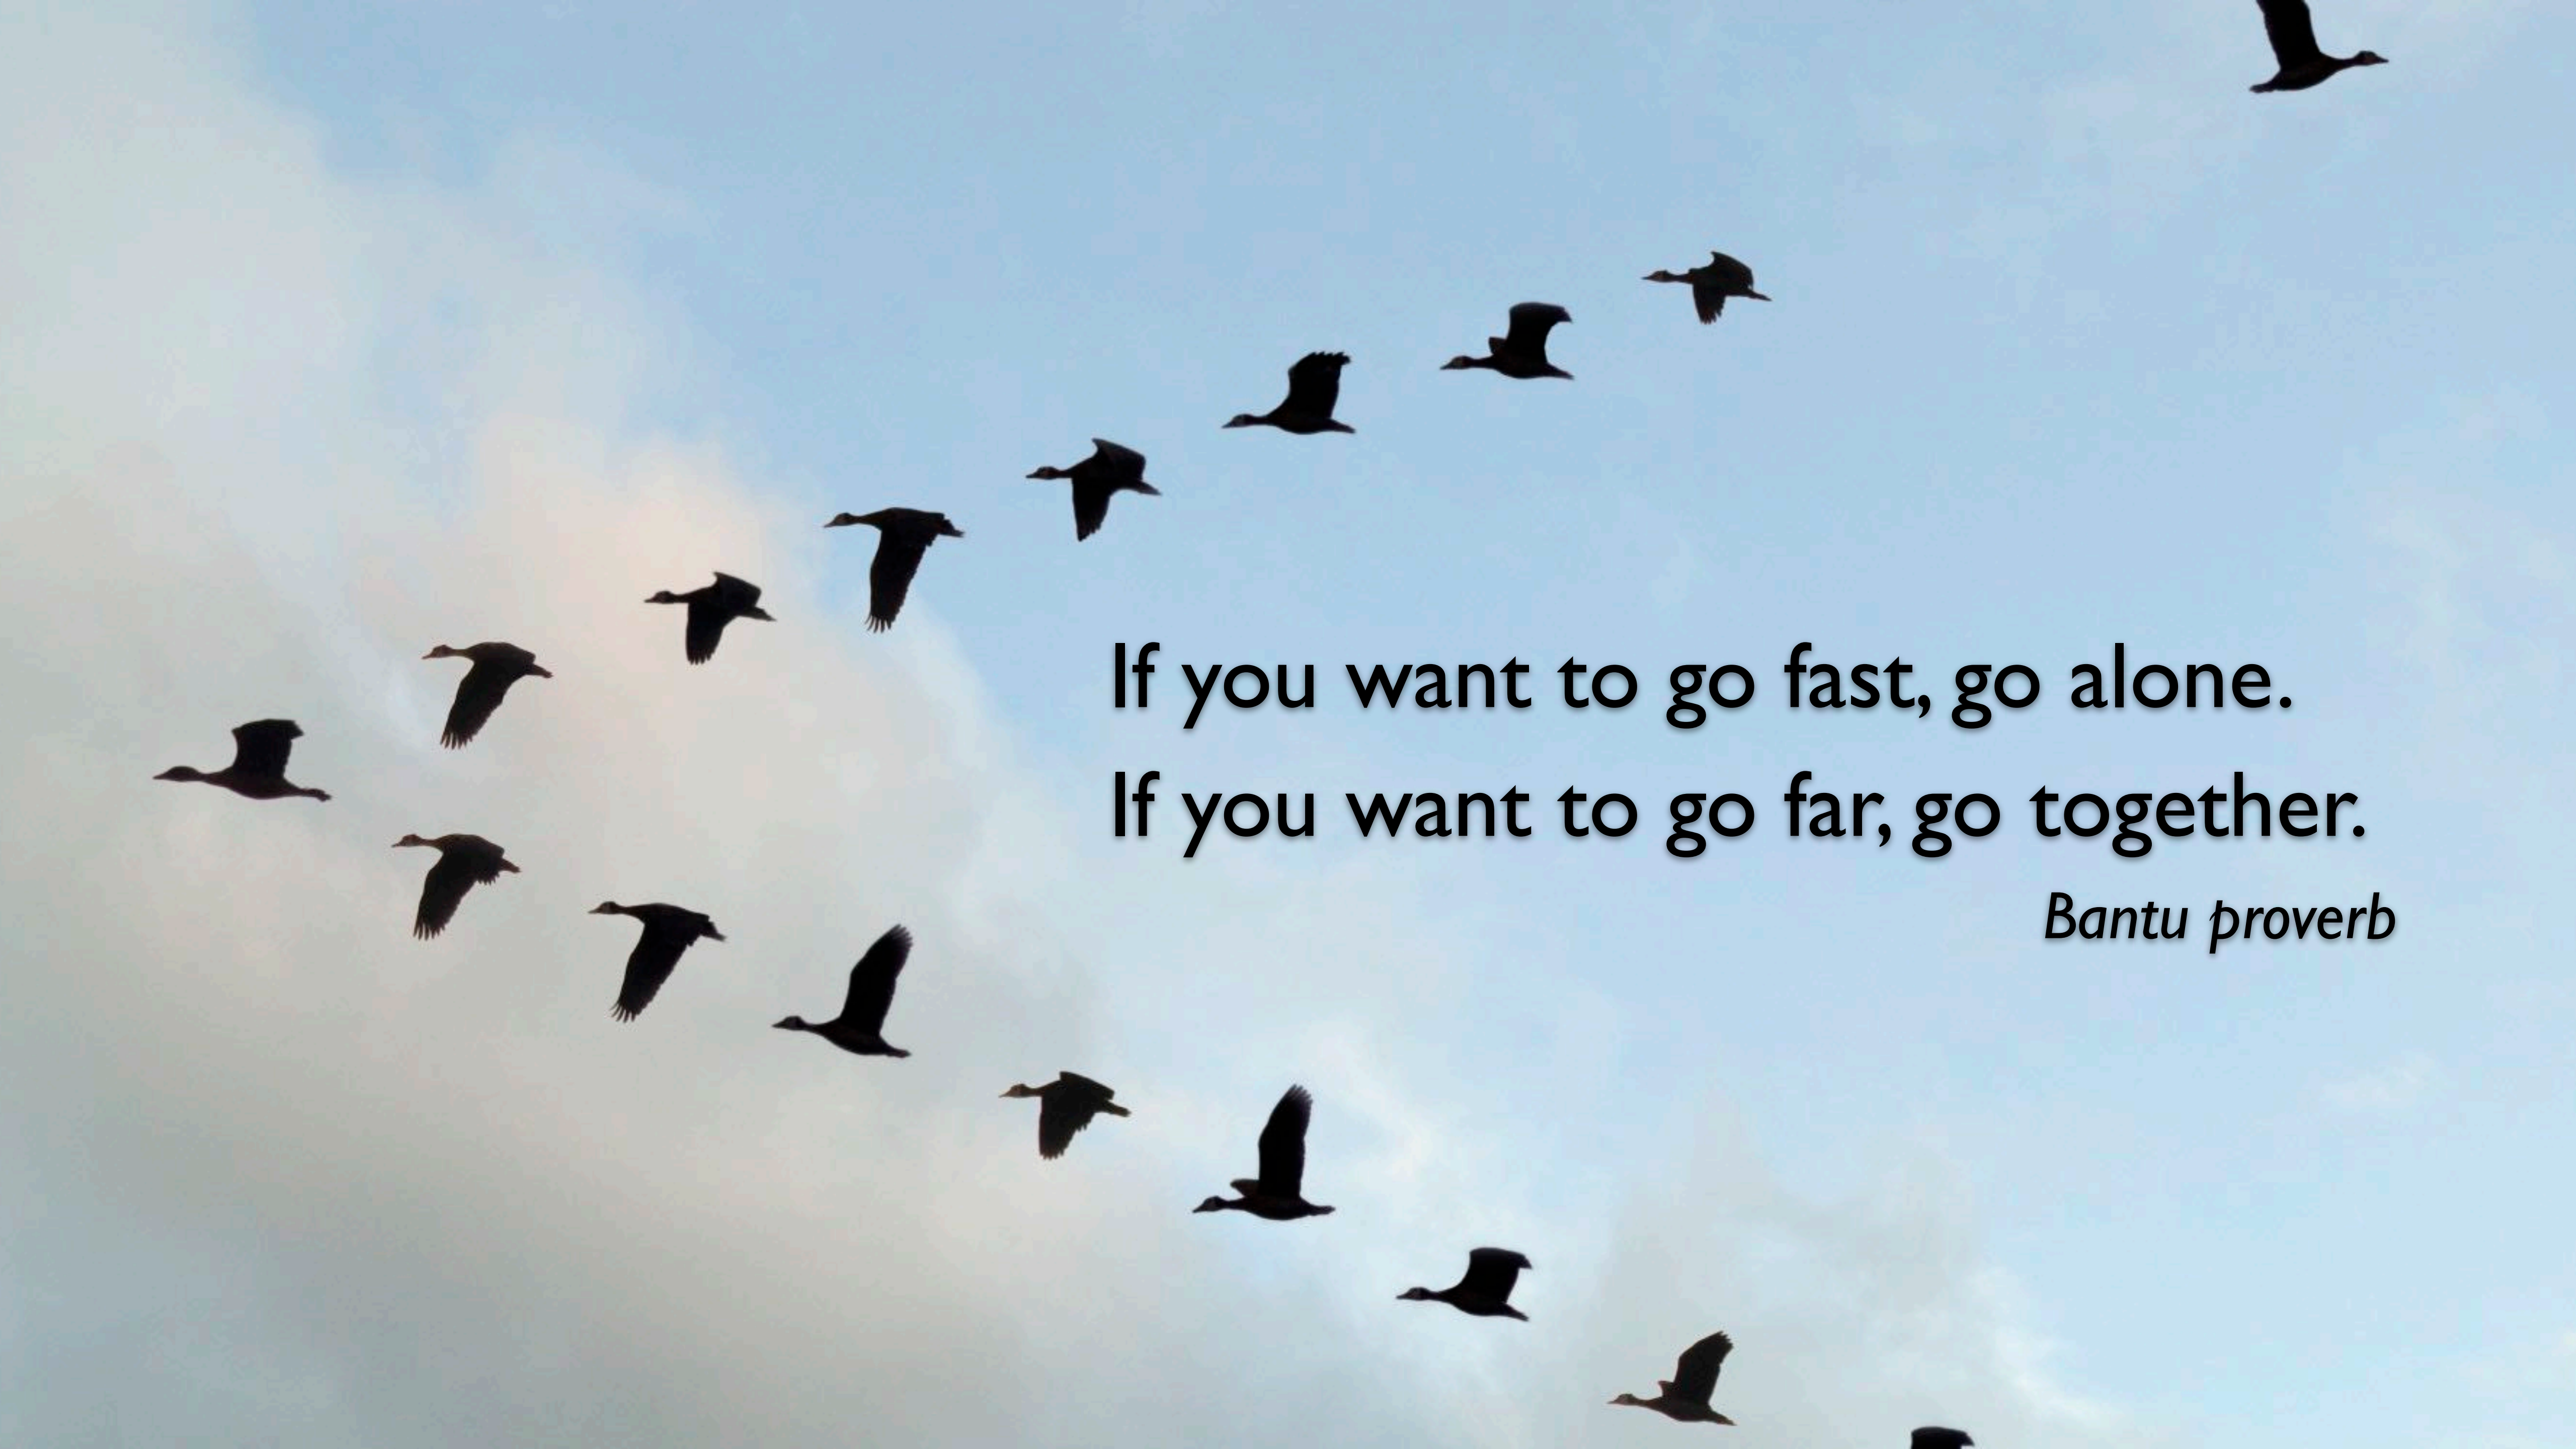

unit testing

A software development process in which the smallest testable parts of an application are individually and independently scrutinized for proper operation.

- + Good housekeeping
- + Helps achieve consistency/stability
- + Facilitates technology and knowledge transfer
- + Reduces vulnerability
- + Collaborative infrastructure – don't break others' code
- Requires time and effort

A flock of birds, likely geese or swans, is captured in flight against a bright blue sky with wispy white clouds. The birds are arranged in a loose V-formation, with some leading and others following. Their dark silhouettes contrast sharply with the light sky. The overall mood is one of freedom and journey.

If you want to go fast, go alone.
If you want to go far, go together.

Bantu proverb
